

A Party positions in speech

Five of six parties move towards the liberal pole, the CDU/CSU holds, the AfD enters beyond the previous range

B System level and system spread

Dashed = the same series with the AfD removed and the weights renormalised (A)

Migration position score = (restrictive - liberal) / (restrictive + liberal), scheme B, filtered_000, native tau, code 305 included, speech channel weighted by seat share. The dispersion measure is mean-invariant, so the two panels answer different questions: whether the parties moved apart, and whether the chamber as a whole moved. Panel A runs on the 38-cell table, panel B on the canonical H3/H2c series.
